Power Generation

Power plants typically have a complex underground maze of utilities and subsurface obstructions. CNI Locates can determine the location of these subsurface utilities/objects prior to any construction or renovations. CNI Locates helps to minimize the risk of subsurface damages and compliments your efforts to confirm the viability and placement of your desired work area. Let CNI Locates be your one stop shop for subsurface damage prevention.

Power Substations

There are many dangers that can occur when excavating within substations. For most brownfield substations, drawings and utility records are inadequate and out of date. Existing duct banks, services, empty conduits, ground rings, etc. are some of the common subsurface objects needing to be identified. CNI locates has all the technology needed to mark out utilities inside a compound, resulting in safe and successful subsurface work.

Power Transmission

Whether you are installing a new transmission tower in a rural location or new transmission pole in an urban location, CNI Locates has all the technology to make sure your subsurface work is performed safely. Companies that only utilize public locates (811) can pose many risks. Let CNI Locates assist with locating utilities for every work area, whether in the public right of way or on a private property.

Power Distribution

Distribution of power comes with many subsurface challenges. Power needs a path to go once it leaves the substation. Creating new paths means that poles must be installed or underground duct banks must be created. It is crucial to identify subsurface utilities throughout these processes. CNI Locates has the ability to be on site within 24 hours of the original service call (Monday - Friday).
